

ABSTRACT

5 A produce bag has a pair of perforated thin plastic side walls forming a trapezoidal-shaped envelope with an access opening. A plastic zipper portion is disposed along each of the single pair of side wall edges at the opening, the pair of side wall edges being adapted to nest with one another so as to be capable of zip-closing and zip-opening the access opening. In one alternative embodiment, a zipper closure clip is slidably attached to the single pair of side wall edges and is adapted to alternatively zip-close and zip-open the access opening.
